TABLE OF CONTENTS

Established in 1946, Protek Specialty Company has remained strong in achieving and maintaining the main vision of its founder, Samuel Eric Moore. That vision was to manufacture small, specialized equipment that other companies needed in the irrigation and oil fields for moving and removing liquids. That vision to manufacture specialized quality pump primers combined with excellent customer service remained the ideals that were carried through his son, Don Eric Moore. As of 2020, Divina Moore has taken the reigns to drive Protek to a new phase of growth with new initiatives and creative ideas.

Our goal will always be to continue to work hard at keeping our customers satisfied.

RETURN GOODS POLICY

NON-DEFECTIVE GOODS

1. Customer must call or email Protek to receive a Return of Goods Authorization (RGA) number.
2. The material must be new or unused and in saleable condition.
3. Proof of the purchase or copy of the invoice must be furnished.
4. The material must be returned freight prepaid - If the return is the result of customer error, the customer is responsible for incurring all shipping costs.
5. A 15% restocking fee will be applied to all returned goods under 90 days. For all returned goods over 90 days, a 25% restocking charge will be applied.
6. Upon receipt and inspection of the material, credit will be issued at the purchase price less the restocking charge.
7. There are NO returns allowed on diaphragms over 90 days old.
8. There are NO returns on nuts and bolts.

DEFECTIVE OR PROBLEM GOODS

1. Send proof of defective goods to sales@protekspecialty.com.
2. Protek will then contact customer immediately to issue a Returned Goods Authorization (RGA). Proof of the purchase or copy of the invoice must be furnished.
3. Protek will issue a replacement at no charge (subject to review and contingent on warranty status). If the item is no longer under warranty, a replacement will be sent at current cost.
4. Upon receipt and inspection of the returned goods, a credit memo will be issued for the purchased price (if applicable).

**** Please ensure to print the RGA Form and include it with your return in order for it to be accepted. ****

GOODS DAMAGED IN TRANSIT

1. If the product is damaged by UPS, Freight Lines, or Parcel Post, the customer must notify Protek Specialty Co. immediately.
2. The package should be left as it was received in the event that a freight company representative is dispatched to inspect the damage.
3. Send photo of damaged package to sales@protekspecialty.com.
4. Protek will ship replacement at no charge contingent upon claim approval by the carrier.

**** Customer assumes responsibility for all charges if claim is denied by carrier. ****

WARRANTY

LIMITED WARRANTY

All our manufactured products have a one-year warranty from the date of purchase (90 days for diaphragms). Factors that will void the warranty include:

- Alterations done outside our factory
- Misuse, negligence, use of cheater bars, or accident.
- Warranty does not apply to Damage in Transit.

Our obligations under this warranty are on units that have met all the proper requirements and have been determined to be defective by one of our team members in material, workmanship, or both.

We reserve the right to make changes in the design and make improvements on our products, without obligation to install the same to our products already manufactured.

There is no other express warranty.

DP SERIES **HAND DIAPHRAGM PRIMER**

The HAND DIAPHRAGM PRIMER is an air pump that creates vacuum in a centrifugal pump priming line and pulls water up into the pump to prime it. The Diaphragm Primer has a flapper check valve in the diaphragm and a disk check valve at the bottom of the unit. Air flows through the bottom check valve on the diaphragm up stroke then through the diaphragm valve on the down stroke. Diaphragm is actuated through a connecting rod eyebolt attached to a fulcrum handle bracket.

FEATURES:

- Lightweight aluminum alloy body
- Easily mounted on most centrifugal pumps
- Tough and durable rubber diaphragm
- Units have a drain valve

INSTALLATION & OPERATION:

1. Attach primer to centrifugal pump or skid.
 - Use non-collapsible hose or flexible tubing to connect primer suction inlet to pump.
2. Install cut-off valve between the primer suction inlet and pump.
3. Close cut-off valve immediately after priming.
 - Make sure primer drain valve is closed.
 - A cut-off valve should be used at the pump discharge to prevent air from being drawn through the discharge line while priming.

MAINTENANCE:

- Remove any debris under the diaphragm after each use.
- Clear all fluids from inside the unit after each use.

TROUBLESHOOTING:

If the Diaphragm Primer is not priming the pump, check the following:

- Make sure drain valve is closed.
- Inspect check valve for blockage and free movement. Any debris can cause clogging, or prevent the valve from sealing properly.
- Connecting hoses should be straight and clear of debris.
- Check suction side for air leaks.
- Call Protek Technical Support for additional help.

EP SERIES

EXHAUST PRIMER

EXHAUST PRIMERS are comprised of an ejector and cast iron adapter that has a cap and handle attached. Unit operates on low engine exhaust pressure. When exhaust valve (adapter cap) is closed, gases are directed through ejector and water is drawn to pump by ejector vacuum.

*NOTE: When ordering an Exhaust Primer, the ejector size is determined by the engine displacement in cubic inches, and adapter size is determined by the outer diameter of the exhaust pipe and whether or not the pipe is threaded. E.g., Engine displacement is 250 cubic inches and the diameter of the exhaust pipe is 3 inches, therefore you need an EP250-300 3NPT.

FEATURES:

- Simple design, no moving parts
- Cast iron adapters come in a variety of sizes, to be mounted on a plain-ended or threaded exhaust
- A vacuum gauge and tee are included.
- Priming can be completed in 10 seconds to two minutes
- Suction lifts of 20 ft. may be obtained under typical conditions
- Units are designed to produce vacuum of 18 to 22 inches of mercury (Hg)

INSTALLATION & OPERATION:

1. Use adapter to attach ejector to engine exhaust stack.
 - Pump discharge must be closed while priming. This can be done by installing a discharge check valve or hand operated gate valve.
2. Install vacuum gauge and priming valve on priming line, between the valve and ejector.
 - Vacuum gauge should indicate priming rate of 18-22 Hg.
 - PSIs should be between 12 and 15 or 1500-2300 RPMs.
3. After priming is completed, lay handle and brass cap 180 degrees from priming position to allow exhaust to escape.

MAINTENANCE:

- Before every use, check the unit for accumulated build-up of dirt or soot from the engine exhaust.
- If vacuum gauge is not working, replace before using the Exhaust Primer.

SAFETY & RECOMMENDATIONS

- Exhaust Primers will not work effectively on single cylinder or two cycle (two strokes) engines.
- Tachometer on engine is useful to determine RPM.
- Priming line air leaks may prevent priming.
- Protek does not recommend the use of EPs on turbo engines.
- Call Protek Technical Support for additional help.

HP SERIES

HAND DIAPHRAGM PUMP

The HAND DIAPHRAGM PUMP is a single-chamber air and liquid pump. The chamber has 2 opening flapper valves for suction and discharge. The diaphragm is actuated by the fulcrum handle bracket, air and/or liquid is pulled into the chamber through the suction valve and expelled through the discharge valve.

FEATURES:

- Ideal for priming pumps or as portable pump
- Large inlets allow transfer of many types of liquids
- Upon request, unit can be provided with a wooden base to optimize stability for tough primes
- Easily delivers up to 30 GPM
- Maximum leverage design facilitates easier pumping

INSTALLATION & OPERATION:

1. Insert handle into fulcrum, making sure that fulcrum and handle holes align before inserting the fulcrum pin.
2. Place pump on a solid foundation that is as close as possible to the fluid that is going to be pumped. *(This positioning should make the suction line as short and direct as possible.)*
3. Attach suction pipes to the suction inlet and to the discharge outlet.
 - Suction line must be sloped upward in order to provide continual feed into the pump.

SAFETY & RECOMMENDATIONS

- For longer lasting diaphragms and valves, flush the pump with several gallons of water after each use.
- Replace the diaphragms and valves that show signs of wear, cracking or corrosion.

TROUBLESHOOTING:

If you cannot get the HP to prime, try one of the following:

- Make sure there is no debris left inside where the valves are. Any debris can cause clogging, or prevent the valve from sealing properly.
- Inspect the diaphragm for any tears or cracks.
- Check the line for any blockage or loops. The line must be straight and not twisted in any way.
- Check all sections of the suction line for air leaks.
- If the eyebolt assembly becomes loose from the diaphragm assembly:
 1. Remove the bolts which connect the retainer ring and pump body so that the diaphragm assembly can be removed.
 2. Remove the diaphragm assembly and tighten the jam nut located on the underside of the diaphragm assembly until the bottom jam nut is even with the bottom of the eyebolt.
 3. Re-assemble the pump by reversing the dis-assembling process. **When re-assembling the pump, have the pump's discharge side to your left, and make sure that the opening of the eyebolt is facing you.*

22" x 17" x 27"

Shipping Wt. - Approx. 108 lbs (3 HP Honda)

The MOTORIZED DIAPHRAGM PUMP pumps water, brine, mud, sewage, petroleum products and many chemicals. They are low maintenance units.

FEATURES:

- Self-priming Motorized Diaphragm Pumps can run dry without damage to the pump seal
- The natural rubber compound diaphragm is strong and long lasting
- Easy to replace valves
- Steel base for secure mounting
- HP700 E & G units are equipped with a carrying bar
- Units range from 26-32 GPM

INSTALLATION & OPERATION:

1. Determine pump location and, if desired, secure in place ($\frac{5}{16}$ " bolts recommended).
2. Connect suction hose or pipe to suction flange.
3. If desired, connect discharge hose or pipe.
4. Connect power source (electric models).
5. Start pump; may be operated indefinitely.

SAFETY & RECOMMENDATIONS:

- To extend diaphragm and valve life, flush the pump with water after each use.
- If pumping liquid other than water, flush thoroughly with water after use.
- Replace the diaphragm and valves that show signs of wear, cracking or corrosion.
- For AC models: make sure electrical connection is properly grounded.
- Keep clear of rotating and reciprocating components.

AVAILABLE MOTORS FOR HP700E & HP700EF	
PART#	DESCRIPTION
P5004	1 HP, 1 Phase
P5004-1	1 HP, 3 Phase
P5009	1 HP, 12 Volt DC Direct, 1750 RPM

AVAILABLE MOTORS/ENGINES FOR HP700G	
PART#	DESCRIPTION
H0523	3.5 HP, Gasoline Engine, Briggs & Stratton

MP SERIES

MANIFOLD PRIMER

The MANIFOLD PRIMER/Water Trap is a device positioned between a water pump being primed and a source of vacuum pulling the water. It is designed to stop water flow when water reaches it. As a manifold primer it is used when the vacuum source is the intake manifold of a multiple-cylinder gasoline or LP gas engine, or brake booster of a vehicle. As a water trap, it is used when the vacuum source is a vacuum pump. The manifold primer/water trap utilizes a mechanical float valve that stops airflow as water enters the unit, thus "trapping" and preventing the water from continuing past it.

MP1000 - Has $\frac{3}{8}$ NPT flow ports, IN at bottom and OUT at top. Mounting requires four $\frac{1}{4}$ " bolts or screws. Water drains from the unit through the priming line.

MP2000 - Has $\frac{1}{2}$ NPT IN and OUT flow ports on the bottom. Mounting requires two $\frac{1}{4}$ " bolts or screws. Water drains from the unit through an umbrella valve on the bottom.

FEATURES:

- Can be mounted on any surface
- Use on multiple cylinder on gasoline or LPG engines
- Durable clear housing allows operator to observe its functioning
- Brass ball valve included

INSTALLATION:

1. Mount the unit in position so that the float mechanism moves vertically and is at an elevation above the pump priming port.
2. Use noncollapsible hose to connect the unit OUT port to the vacuum source, for example a tee fitting spliced into the vacuum line.
3. Use noncollapsible hose to connect the unit IN port to the pump priming port, with the provided ball valve in between.

OPERATION:

1. Close the priming line ball valve.
2. Close the pump discharge valve to prevent air being drawn through the discharge.
3. Start the vacuum source.
4. Open the priming line ball valve.
5. When water enters unit, close priming line ball valve. (Water entering unit indicates pump is primed.)
6. Start the pump and open the pump discharge valve.
7. Stop the vacuum source then allow the water to drain from the unit.

**NOTE: If water does not flow from discharge, turn your pump OFF and repeat steps 2 through 5. When pump is discharging properly the priming line may be disconnected from primer and the engine providing vacuum turned OFF.*

MAINTENANCE:

- Chamber housing should be kept clean in order to observe the float valve.
**If necessary, remove the unit and flush with water or a mild soap solution.*
- Use only soap and water to clean plastic parts.
**Do not use any harsh cleanser or chemicals to clean the unit.*
- Do not tighten tie bolts or plastic dome more than necessary to provide seal.
- Keep the priming line ball valve closed when manifold primer/water trap is not in use.

PP SERIES
POWER PRIMER

The POWER PRIMER is built for fast and efficient priming in pump installations with high suction lifts or extra suction lines. Our motorized line of power primers come in AC, DC or gasoline models and work well for a variety of applications. They are ideal for large, diesel-powered irrigation pumps.

FEATURES:

- Vacuum Pump self-lubricating vanes make maintenance easier
- Vacuum Pump dual fan guards meet OSHA's safety requirements
- Clear, plastic water trap housing indicates when priming is completed
- AC single phase model has 8' electrical cord with switch
- Solid base provides a sturdy mounting platform
- Standard ½" NPT vacuum connection

COMPARISON

	CFM	PSI (max.)
PP35AC/DC/GAS	8.5	25
PP35HC	17	15

** Both the standard Power Primer and the High Capacity have a vacuum capability of 28" HG Max.*

INSTALLATION & OPERATION:

1. Mount the Power Primer securely to a plate on the engine or centrifugal pump.
 - *NOTE: Primer should be high enough to allow water to drain back into pump suction line.*
 - *Position the unit to provide easy access to lubricators, filters and mufflers.*
2. Install oil reservoir, vacuum gauge, filter jar and muffler. See vacuum pump manual, included.
3. Fill oil reservoir with quality SAE 10 or 10W-30 motor oil.
4. Install hand valve between the power primer and the volute of the pump.
5. To start priming, open priming line valve and turn primer ON.
6. Watch for water to appear in water trap. Then turn pump OFF and CLOSE priming line.

SAFETY & RECOMMENDATIONS:

- Make sure that electrical connection is grounded.
- Do not operate primer without drive guard.

MAINTENANCE:

- The Vacuum Pump requires occasional flushing. Remove the pressure gauge and run ¼ cup of flushing solvent (GAST AH 225 or equivalent) through pump.
- A brief warm-up may be required for pump to produce a vacuum.
- Perform initial inspection after 500 hours.
- Use engine oil with viscosity of SAE10 when refilling oiler.
- Clean or replace air filters as needed.
- Keep water trap clear of debris.
- Replace parts that show evidence of dryness or cracks, esp. for parts such as cork gaskets and rubber gaskets for the oiler.
